Short explanation of the model

LIFT@austria

Imagine the Model of Evolution of (business) ecosystem (MEE) being spiral envelope. Inside that envelope the circles/balls of the Model of Sustainable Cohesion (MSC) is spinning. Smaller the circle/ball faster it spins in relation to the larger one.

Even the MEE is not static but is regenerating around its own spiral center, e.g., the working space can be repeated, yet re-adjusted, based on evolution experience of the prior levels.

Due to the forces between the structures (0 space within and among the balls) the real speed and direction is unpredictable for those within a particular ball.

MSC seem to be driven by the level of density of consciousness of everything there is.

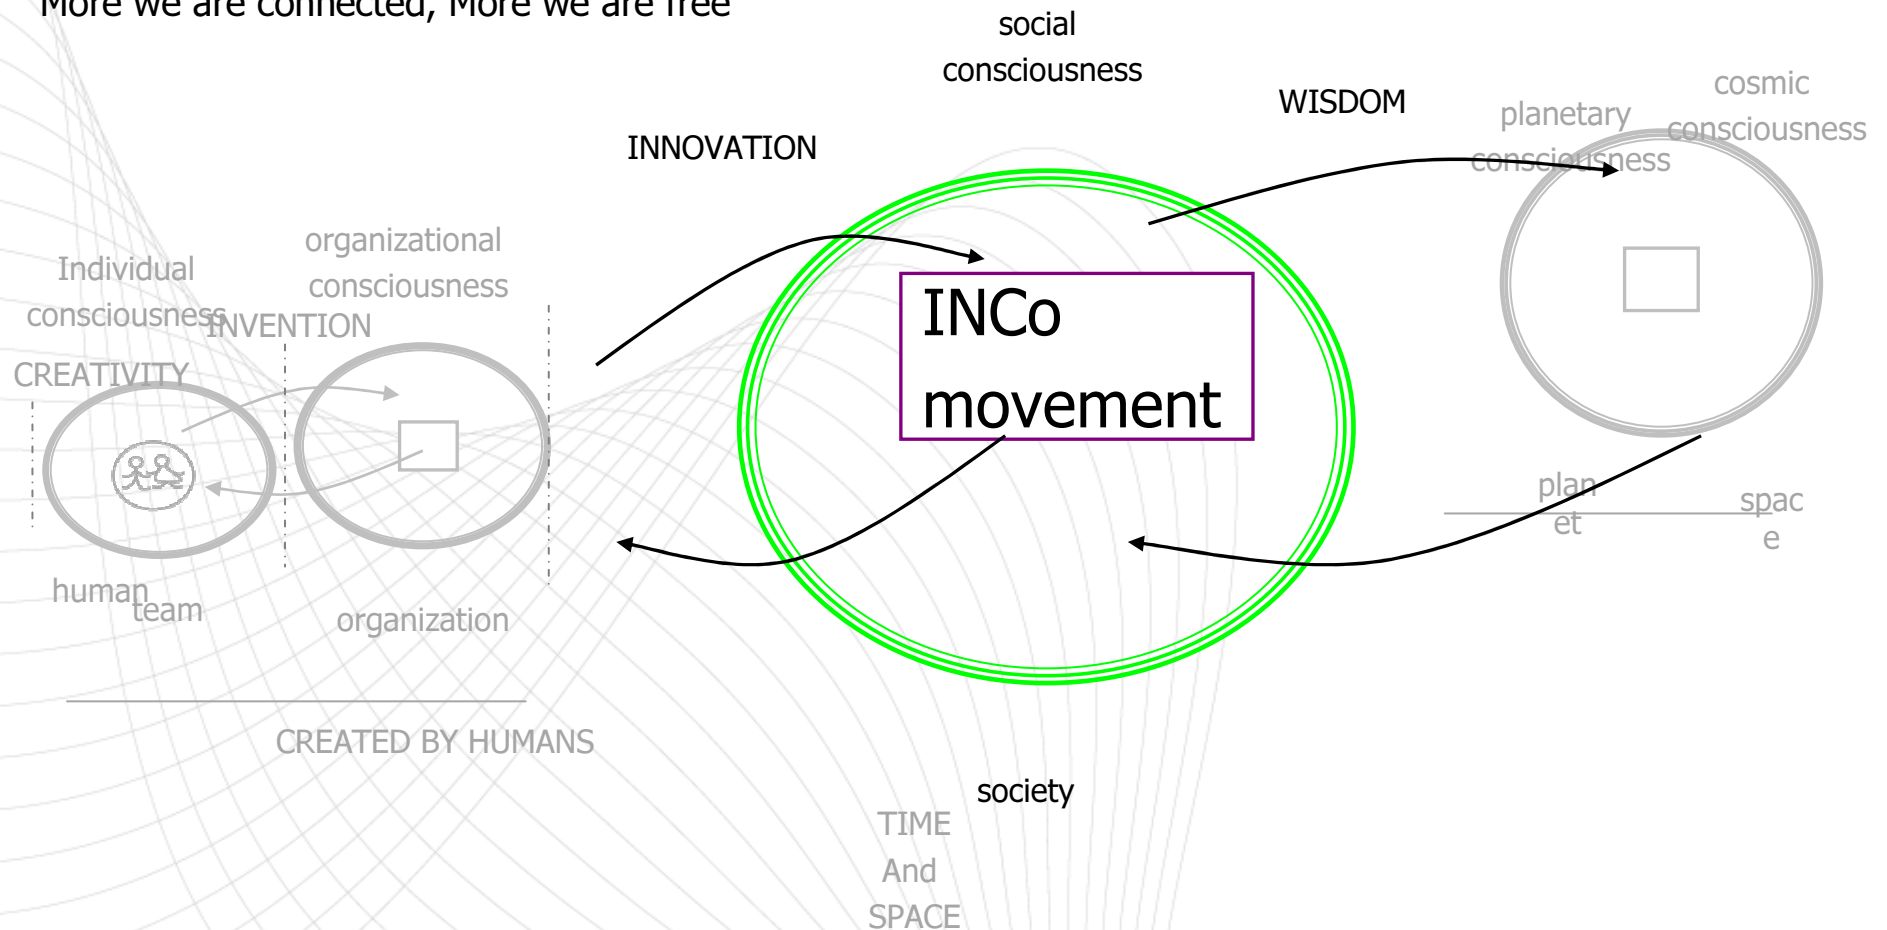

The level of energy and engagement of elements of MSC seem to correlate with the phase of MEE.
